

Base Stocks & Additives SELECTION GUIDE

Synthetic esters, with their polarity and uniform structure, provide multiple high performance functions in lubricants:

- As a base stock or as an additive, esters improve lubricity, improve the solubility of additives, have an affinity for metal surfaces and improve cleanliness and sludge control.
- Versus mineral oils, the ester structure offers lower volatility at lower molecular weight and lower viscosity.
- Esters can be selected to provide extreme high temperature performance, extreme low temperature performance or both.
- Esters provide or enhance seal and gasket compatibility.
- Esters generally offer high thermal-oxidative stability.

Esters can be combined with PAO's or mineral oils to improve seal swell, solubilize additives, reduce volatility and improve energy efficiency.

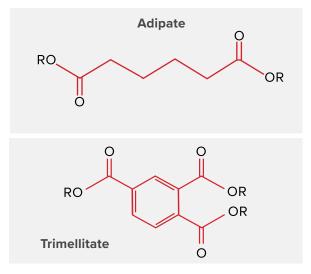

Many esters are used in environmentally acceptable lubricant applications due to their biodegradability and low toxicity.

Synthetic Ester Types:

Diesters

Adipates make a great base stock or blend component when biodegradability or high-temperature cleanliness is important. Diesters may also be used in combination with PAO's or Group III's for engine, compressor, gear, transmission, hydraulic and other oils.

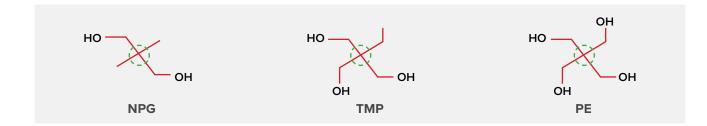

Trimellitate esters are often a cost effective alternative to high viscosity polyol esters. They are used where low volatility, thermal stability and high lubricity are needed. Applications include compressor lubes, gear oils, chain lubes and greases.

R = Alkyl group

Polyol Esters

Esters of Polyols, such as NeoPentyl Glycol (NPG), Trimethylol Propane (TMP) and PentaErythritol (PE), get their high performance and stability from their core Quaternary Carbon structure. That, along with their high polarity, further attracts the esters to metal surfaces which enhances lubricity. From refrigeration lubes to oven chain lubes, polyols can be customized for almost any application.

Performance Advantages:

Gears, including Industrial, Automotive & Wind

- · High or low viscosity performance
- High viscosity at elevated temperatures
- Improved thermal & oxidative stability
- · Great solubilizing characteristics

Chain Oils

- High temperature performance
- Low coking, low residue

Hydraulic Fluids

- Biodegradability
- · Fire resistance, low volatility

Compressor

- · High or low viscosity performance
- High thermal and oxidative stability
- Natural detergency, low varnish
- Polyol esters are primary base stock for HFC refrigerants

Engine Oils

- Meet increasing demand for low viscosity, high VI
- Low pour point, low cold crank viscosity
- Lower volatility
- Solvency, seal swell, and lubricity

Greases

Great for high and low-temperature application
